

TASK VIDEO-IMPORT App - Download Media-file from URL – for Android

Programming must be made in the following programming languages:

Cordova version 10.0.0

IONIC framework version 5.4.16

Android SDK Tools 29

Design - it must look like this - the most recent video is always on the top – when the app is installed a directory “Video-Import” is created in Android directory. There all videos will be stored.

Procedure of a video import:

1. USER opens the App and inserts URL into input field
2. User press „→ button“
3. simple **URL Dialog window opens** and display the existing downloadable video formats of the URL. Allowed formats for display and download: mkv', 'mov', 'mp4', 'webm'
5. User is shown a list of available video resolutions if available.
6. User selects the video and the resolution.
7. User can rename the video if he like
8. User presses Download. Or Cancel.
9. simple **URL Dialog window closes** and Video is added to the list and download in selected resolution begins
10. USER can see the progress of the download.
11. USER can pause the download or delete the download from list (if delete in the list, the video is also deleted in the video-import folder inside Android directory)
12. USER can close the app

Please note :

!!! Payment will only be made if the code is tested and working as it should !!!

The Developer agrees to this terms and conditions once he has accepted the milestone.
